

## Why?

- Much of the existing infrastructure, items we use, products we produce, and performance metrics, will need to be enhanced. Supply chain management is the profession about to be thrown into the front line of the battle against climate change.

## Why?

- The Global 500 has reduced carbon emissions within its corporate operating or legal boundaries. The methodology used by the Global 500 to inventory, and subsequently plan, the reduction in carbon emissions is the Greenhouse Gas (GHG) Protocol, and Scopes 1 and 2. There is an increasing focus on Scope 3, the supply chain.

## Why?

- Supply chain inputs contribute 80% of the total carbon emissions in a final product. While this increased focus will create challenges, it's also a possible career enhancement opportunity.

## Why?

- Drought and extreme water shortages are caused by global warming and climate change. Managing and reducing water consumption is another critical performance metric.
